Statistical Learning; Final Project and Examination

ACIT4510, Master's Programme in ACIT 2026–2027
Shailendra Bhandari, Kristian Wold, and Pedro G. Lind
Department of Computer Science OsloMet – Oslo Metropolitan University, Norway

16 November 2026

Purpose

This project gives you an opportunity to apply statistical learning to a problem of your choice. Your report should demonstrate your understanding of the course content through a clear analysis, justified methodological choices, and a critical interpretation of the results.

What should you do?

Choose a publicly available dataset and formulate **one main research question** that can be investigated using statistical learning. Analyse the data using suitable methods covered in the course. Explain your choices, evaluate the results, and discuss what you can conclude.
An approved project plan describing the dataset, a preliminary research question, and proposed tools and methods is required before you can take the examination.

What should the report include?

You may organise the report as you wish, but it should address the following:

- **Introduction:** State the research question and explain its relevance.
- **Data and methods:** Describe the dataset, data preparation, and statistical learning methods. Justify your choices and explain how you evaluate the analysis.
- **Results:** Present the main findings using clear figures, tables, and explanations.
- **Discussion:** Interpret the findings in relation to your question. Discuss limitations and relevant assumptions.
- **Conclusion:** Answer the research question and summarise the main findings.
- **References:** Cite the dataset and all external sources used.

The assessment will consider your understanding of statistical learning, the suitability of your methods, the quality of your analysis, and how clearly you justify and interpret your work.

Examination and assessment

The examination consists of two individual parts:

- **Project report:** Approximately **2,500–5,000 words**, excluding appendices. Counts for **30%** of the final grade.
- **Oral examination:** A **15-30 minute** individual oral examination. Counts for **70%** of the final grade.

Both parts must be passed to pass the course. Only the project report can be appealed. The grading scale is A–F.
All aids are permitted, provided that the rules on plagiarism and source referencing are followed. Consult Canvas and the examination system for submission instructions and deadlines.
For formal requirements, see the assessment section of the official course description. Further guidance is available in the course slides *Aimof the Course* and *An Introduction to Statistical Learning*.

Use of artificial intelligence

AI tools may be used in accordance with OsloMet's guidelines on AI use in student work `https://student.oslomet.no/veiledning-kunstig-intelligens-studentoppgaver`. You remain responsible for all submitted content.
